Heads up:

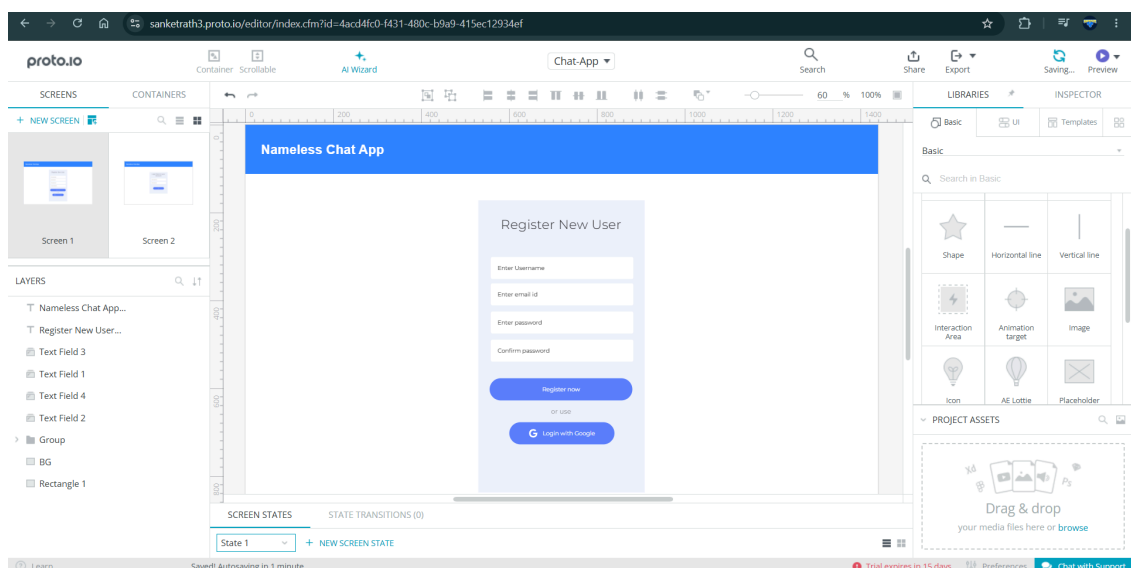

I am building a simple AI chat app with the following technologies.

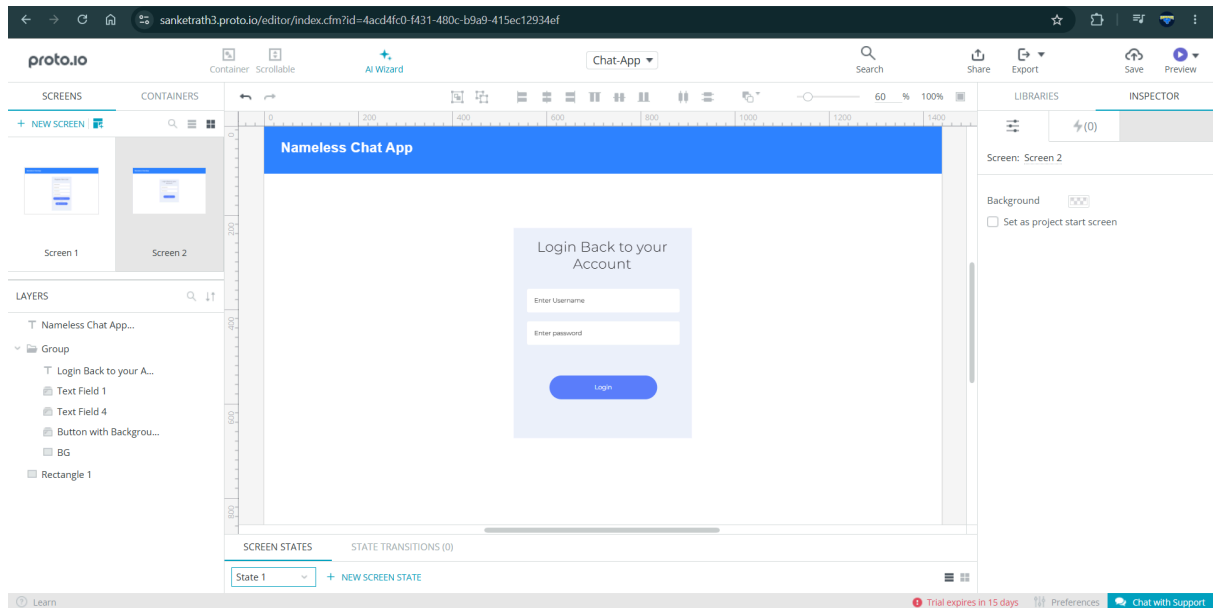

- Backend: FastAPI (async, high performance)
- Frontend: React (Vite) + Tailwind CSS
- Database: PostgreSQL
- AI Layer: OpenAI API + LangChain
- Vector DB: FAISS or Chroma
- Auth: JWT + bcrypt
- Deployment: Render (backend) + Vercel (frontend)

Today's Progress:

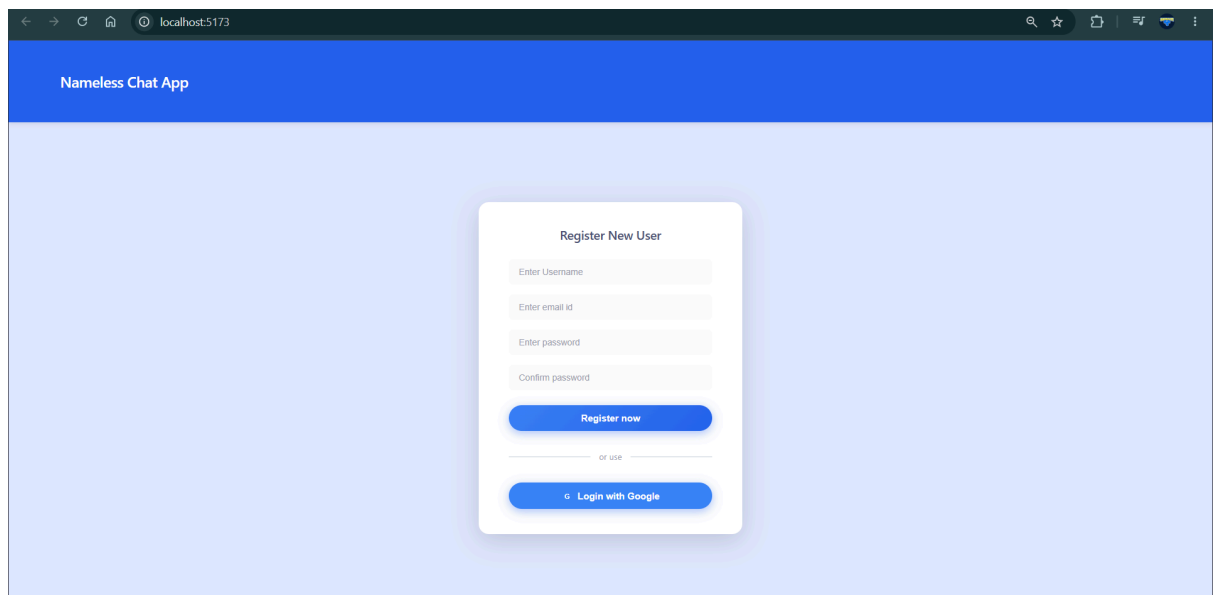

In the morning, I started by debugging the previous codes and removed all the errors. After that I started with the front-end Development of the project.

I started watching the video from freecodecamp to learn React. For practice i started with 2-3 small apps to understand the basics. Next, I designed the registration and login page for the app using [Proto.io](https://proto.io) - a free tool that helps in designing webpages easily.

After this, I tried to re-create the registration page into the project directory. I made some small changes in the final design as well. This is the final view of the registration page.

1. React Tutorial: [React Course - Beginner's Tutorial for React JavaScript Libra...](#)

Next Checkpoint:

Tomorrow, I will complete watching the tutorial video and also complete the login and main page of the website. After that, I will start with the RAG based chatbot to be included in the website.
